Introduction

We are going to create a management system for an office administrator (known as "admin") to manage products. Only admin can view and manage these products listing and editing

Each product record comes with a unique identifier number, we call it Global Trade Item Number (GTIN). As background information, the GTIN is developed by the international organization GS1.

On the other hand, there are public-facing pages. They are:

- Public GTIN bulk verification page
- Public Product page

Description of project and tasks

In this project, we create a companies and products management system for an admin to manage these made-in-Thailand products.

It contains management web pages for listing and editing the records. And JSON API for querying and reading the data as well.

This project should be reachable at <http://wsXX.worldskills.org/>, where XX is the seat number.

Admin access

Admin login page is at path `/admin`. The login page asks for a passphrase to proceed the authentication. A passphrase "admin" can be used to access the admin management system.

We do not require robust authentication. The management system uses simple passphrase-based checking.

The task is to create a product management system.

Given that the time constant, we focus on the prototype of the companies and products recording management and the proof-of-concept of displaying the product in a public page.

Accessing product editing and management functions without login results in 401 error.

Managing Products

There are different fields in each product, one worth mentioning is the GTIN.

In this project, we simplify the GTIN to be any number with 13 or 14 digits. It could be any sequence of numbers, as long as they are unique for each product. Please validate this GTIN format after form submissions, via server side validation.

Listing products

Admin should be able to list and manage products.

When admin accesses the `/admin/products`, admin can see the list of all products.

Admin can access and manage a particular product by clicking on the product record from the list, or by accessing the following path: `/admin/products/[GTIN]`. [GTIN] is the placeholder of the GTIN field.

For example, given a product with GTIN 3000123456789, accessing the `/admin/products/3000123456789` will be the product management page for this given product.

Hiding and deleting products

Admin can mark products as hidden.

Or a product becomes hidden when the associated company is marked as deactivated.

Admin can permanently delete hidden products.

Creating new products

Admin can view the created product form by accessing the /admin/products/new, and can save newly created products to the database.

For products, we have the following data to store:

- name
- GTIN (Global Trade Item Number)
- description, can be multiple lines of text.
- product brand name
- product country of origin
- product gross weight (with packaging)
- product net content weight
- product weight unit

Product Images Uploading

There could be one image associated with each product. Admin can upload and change this image, or admin can remove the uploaded images.

When no image is uploaded, there is a default placeholder image.

JSON API Outputs

The data can be output as JSON format when accessing GET /json/products.json. When listing the products, the API will show a pagination structure.

A single product can be queried via JSON by GET /json/[GTIN].json, where the GTIN is dynamic.

The product API returns 404 network status when accessing a non-exist product, or a hidden product.

The products list JSON allows querying by using keyword, by GET /json/products.json?query=KEYWORD. The list should show products with name, or description, that contains the KEYWORD.

JSON API Example Outputs

Example product output

```
{  
  "name": {  
    "en": "Organic Apple Juice",  
    "fr": "Jus de pomme biologique"  
  },  
  "description": {  
    "en": "Our organic apple juice is pressed from 100% fresh organic apples, with no added sugars or preservatives. Rich in vitamin C and antioxidants, it's an ideal choice for your daily healthy diet."  
  }  
}
```

```

    "fr": "Notre jus de pomme biologique est pressé à partir de 100% de pommes biologiques fraîches, sans sucre ajouté ni conservateurs. Riche en vitamine C et en antioxydants, c'est le choix idéal pour votre alimentation quotidienne saine."
},
"gtin": "03000123456789",
"brand": "Green Orchard",
"countryOfOrigin": "France",
"weight": {
    "gross": 1.1,
    "net": 1.0,
    "unit": "L"
},
"company": {
    "companyName": "Euro Expo",
    "companyAddress": " Boulevard de l'Europe, 69680 Chassieu, France",
    "companyTelephone": "+33 1 41 56 78 00",
    "companyEmail": "mail.customerservice.hdq@example.com",
    "owner": {
        "name": "Benjamin Smith",
        "mobileNumber": "+33 6 12 34 56 78",
        "email": "b.smith@example.com"
    },
    "contact": {
        "name": "Marie Dubois",
        "mobileNumber": "+33 6 98 76 54 32",
        "email": "m.dubois@example.com"
    }
}
}

```

Example Products JSON

```

{
    "data": [
        {
            (Same as single product JSON structure)
        },
        {
            (Same as single product JSON structure)
        },
    ],
    "pagination": {
        "current_page": 1,
        "total_pages": 5,
        "per_page": 10,
        "next_page_url": "http://wsXX.worldskills.org/json/products.json?page=2",   "prev_page_url": null
    }
}

```

Public-facing Pages

There are two public facing pages, they are GTIN bulk verification page, and public product page.

Public GTIN bulk verification page

There is a page for bulk validating if given GTIN numbers are registered and valid. Any user can input multiple GTIN codes and submit to see the validation result.

A GTIN is valid when it exists in the database and is not hidden.

The page uses a text area to allow users to bulk input GTIN numbers. These numbers are separated by line breaks. Then the page should check each GTIN number and display a list of results, showing if each GTIN number is valid.

If all the given GTIN numbers are valid, a separated "All valid" text and green tick is displayed on the top of the result page.

All Valid	
97800123458696	Valid
97800123458696	Valid
97800123458696	Valid
97800123458696	Invalid
97800123458696	Valid
97800123458696	Valid
97800123458696	Valid

Public Product Page

A product's public page can be reached by accessing the /products/[GTIN]. Where the "product" is static.

The public product page shows the following required field. And is in a mobile-friendly layout.

The required field to display: company name, product name, GTIN number, product description, product image, weight with unit, net content weight with unit.

Users can choose between English for the public product page. The lang attribute for the page, French part and English part is correctly configured.

EN/FR
company name
product image
GTIN number
product description goes here. product description goes here.
weight: 5kg net content weight: 4kg

Instructions to the Competitor

Database and model creation consideration

Please import provided product data from provided media file

Please provide the database dump. The database dump should contain FK-constraints and correct columns. The column type definition shall be reasonable.

Please provide the ER diagram schema.

Please consider the normal form of database.

The GTIN field must be indexed.

Other

You may put your project in a sub-folder or different port. Please redirect to your destination from the path wsXX.worldskills.org/

The path mentioned in this document may be relative to your sub-folder. For example, when mentioning the login page as /login — dependent to your actual setup — it may be actually /public/login, or /index.php/login or at different port such as <http://wsXX.worldskills.org:3000/login>.

Please also provide a file named `expert_readme.txt` to include an executing guide. You must provide this file even if you use the default executing path.

Note if you are using NodeJS, please be aware that the node_modules files for Windows (on workstation) and Linux (on server) are different. Using the wrong node_modules folder may result in unexpected errors.
